3D Origami Swan

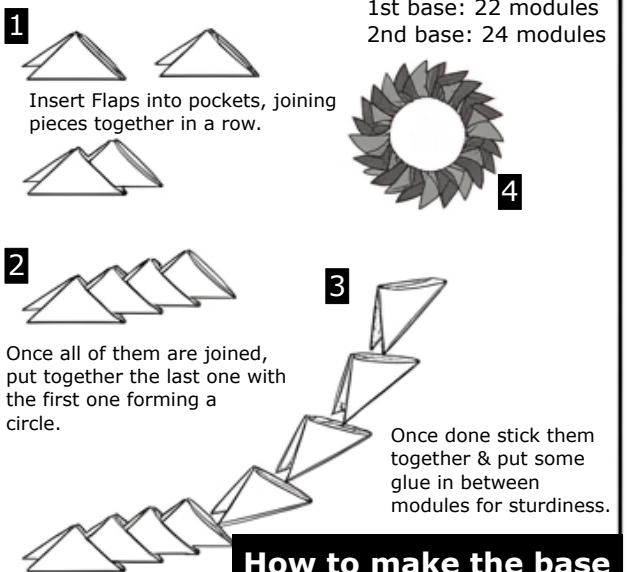

How to make each unit

Paper size: 1:2 (1/2 of a square)

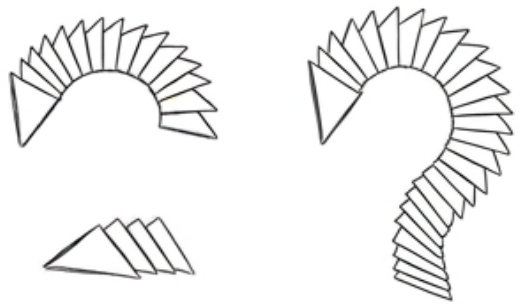

How to make the base

1st base: 22 modules
2nd base: 24 modules

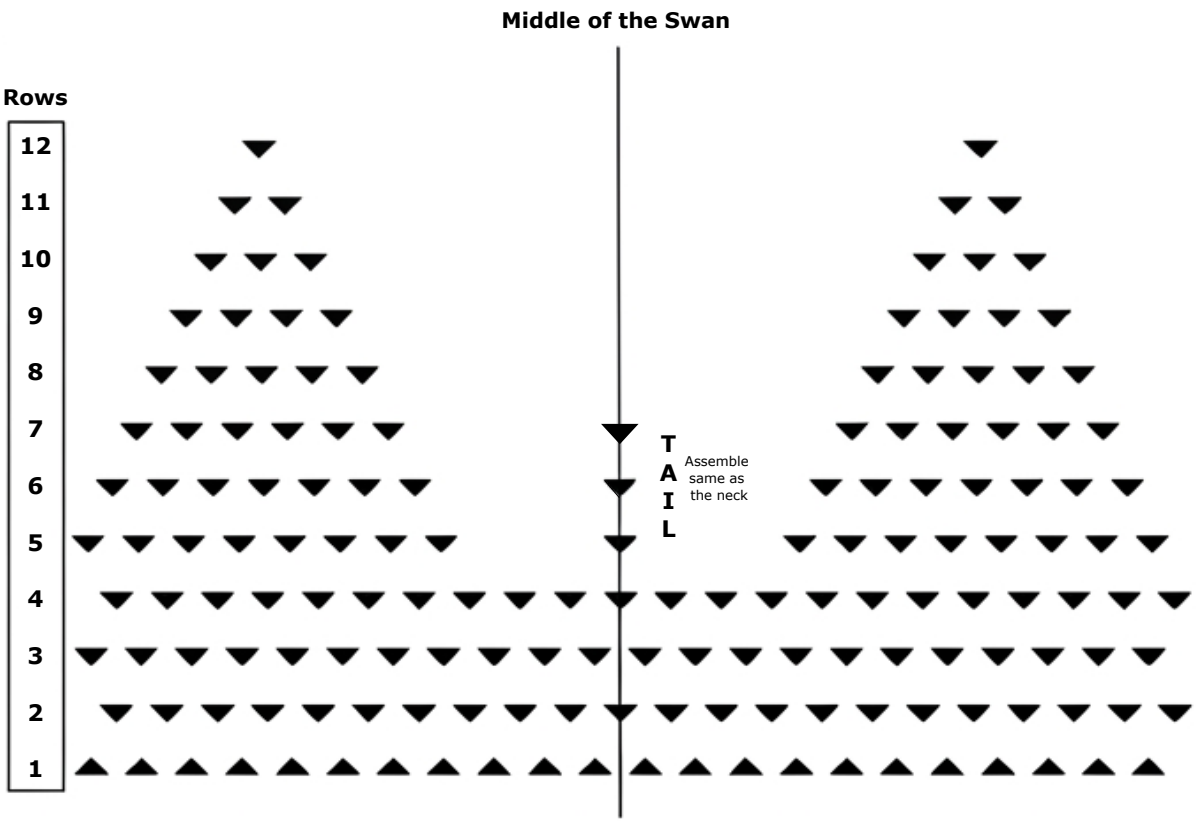

How to make the neck

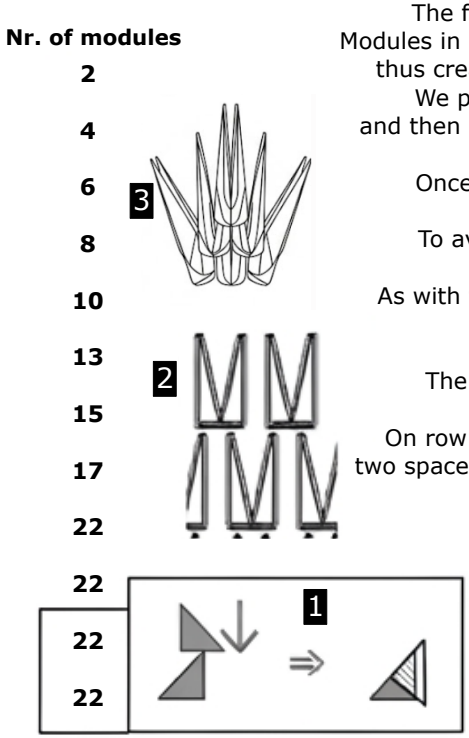

Neck: 17 modules

Joining method for the neck is the same as the base.
Once all together you shape it and put it in the body of the swan.
Once happy with the position, glue in between modules for sturdiness.
Optional: do the last module in red, add eyes and bow.

How to assemble the swan

The first three rows done at the same time.
Modules in row 1 and 2 are placed in opposite directions thus creating the flat base of the swan (**image 1**).
We put on flap on the pocket of one module and then add another module on the other flap, thus locking them together **(image 2**).
Once we start puting the modules together it will be hard to manage them.
To avoid that we will start placing modules of row 3 **(image 3**).
As with the base, once we get to the last module, we close the circle.

The rest of the modules we place them as in image 2.
On row 5 we start doing the wings, we just leave two spaces with no modules from the front & the back for the tail and the neck.
And from there we put on less module on each side until we have the wings.

Attach the neck and the base, glue in between modules for sturdiness.
